## Quadrilaterals

Diagonal of a parallelogram divides it into two congruent triangles.
 In the given figure, if ABCD is a parallelogram and AC is its diagonal then ΔABC ≅ ΔCDA.

**Example:** The area of the parallelogram PQRS is 120 cm<sup>2</sup>. Find the distance between the parallel sides PQ and SR, if the length of the side PQ is 10 cm.

**Solution:** Let us draw a diagonal SQ of parallelogram PQRS and a perpendicular SX on the extended line PQ as shown in the figure.

We know that a diagonal of a parallelogram divides it into two congruent triangles. Also, congruent figures are equal in area.

```
∴ area (\DeltaPQS) = area (\DeltaQRS)

Area of parallelogram PQRS = area (\DeltaPQS) + area (\DeltaQRS)

= 2 × area (\DeltaPQS)

⇒ area (\DeltaPQS) = \frac{1}{2} (area of parallelogram PQRS) = \frac{120}{2} cm<sup>2</sup> = 60 cm<sup>2</sup>

Also, area (\DeltaPQS) = \frac{1}{2} (PQ)(SX) = 60 cm<sup>2</sup>

⇒ (PQ) (SX) = 120 cm<sup>2</sup>

⇒ SX = \frac{120}{10} cm<sup>2</sup>

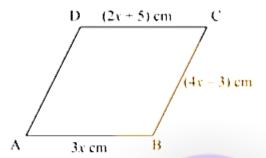

⇒ SX = 12 cm
```

Thus, the distance between the parallel sides PQ and SR is 12 cm.

Opposite sides in a parallelogram are equal. Conversely, in a quadrilateral, if each pair of
opposite sides are equal then the quadrilateral is a parallelogram.

**Example:** In the following figure, ABCD is a parallelogram. Find the length of each sides.

## CLASS24

Solution: We know, the opposite sides of a parallelogram are equal in length.

Therefore, AB = CD

$$3x = 2x + 5$$

$$\Rightarrow 3x - 2x = 5$$

$$\therefore x = 5$$

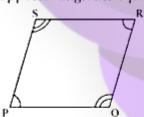

Thus, 
$$AB = 3x = 3 \times 5 = 15 \text{ cm}$$

$$BC = 4x - 3 = 4 \times 5 - 3 = 17 \text{ cm}$$

$$CD = 2x + 5 = 2 \times 5 + 5 = 15 \text{ cm}$$

Also, BC = AD [opposite sides of parallelogram]

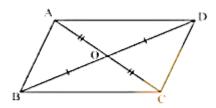

In a parallelogram, opposite angles are equal. Conversely in a quadrilateral, if pair of
opposite angles is equal, then the quadrilateral is a parallelogram.

If in the quadrilateral PQRS,  $\angle P = \angle R$  and  $\angle Q = \angle S$  as shown in the above figure, then the quadrilateral is a parallelogram.

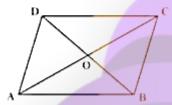

The diagonals of a parallelogram bisect each other. Conversely, if the diagonals of a
quadrilateral bisect each other, then it is a parallelogram.
 Suppose ABCD is a quadrilateral. The diagonals of the quadrilateral intersect at O such that
AO = OC and DO = OB

## CLASS24

Therefore, ABCD is a parallelogram.

**Example:** In the given figure, ABCD is a parallelogram. If OD = (3x - 2) cm and OB = (2x + 3) cm, then find x and length of diagonal BD.

Solution: We know that the diagonals of a parallelogram bisect each other.

$$:: OD = OB$$

$$\Rightarrow$$
 3x - 2 = 2x + 3

$$\Rightarrow$$
 3x - 2x = 3 + 2

$$\Rightarrow x = 5$$

Thus, the value of x is 5.

Length of BD = OD + OB

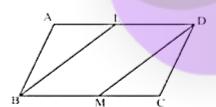

$$=(3x-2)+(2x+3)$$

$$=(3\times5-2)+(2\times5+3)$$

$$= 13 + 13$$

A quadrilateral is a parallelogram if a pair of opposite sides is equal and parallel.

**Example:** In the given figure, ABCD is a parallelogram and L and M are the mid-points of AD and BC respectively. Prove that BMDL is a parallelogram.

Solution: As L and M are the mid-points of AD and BC respectively.

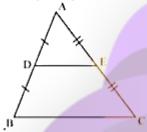

Therefore, 
$$BM = \frac{1}{2}BC$$
 and  $LD = \frac{1}{2}AD$  ... (1)

As BC = AD (Since ABCD is a parallelogram)

## CLASS24

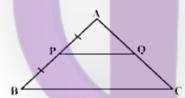

$$\frac{1}{2}BC = \frac{1}{2}AD$$
⇒ BM = LD ... (2) (From (1))
Also, BC || AD
⇒ BM || LD
Hence, BMDL is a parallelogram.

 Mid-point theorem states that the line segment joining the mid-point of any two sides of a triangle is parallel to the third side and is half of it.

In  $\triangle$ ABC, if D and E are the mid-points of sides AB and AC respectively then by mid-point theorem DE  $\parallel$  BC and DE =  $\frac{BC}{2}$ 

Converse of the mid-point theorem is also true, which states that a line through the midpoint of one side of a triangle and parallel to the other side bisects the third side.

In  $\triangle ABC$ , if AP = PB and  $PQ \parallel BC$  then PQ bisects AC i.e., Q is the mid-point of AC.
